

The optimal cogeneration unit

You are planning to renew your heating system in the course of modernization measures? You would like to build and you are looking for a cost-lowering, energy-saving plant for the energy and heat production? You are looking for a way to lower substantially your operating costs?

The technology of the combined heat and power (CHP) in a cogeneration unit is as safe and solid as a conventional heating. We call it the electricity producing heating. With one combined heat and power unit (CHP) you lower your operating cost substantially. At the same time you win tax benefits compared to conventional energy production. Additionally we use more effectively our resources and relieve enormously the environment.

This promising technology needs a strong service partner. In principle CHPs are applicable from the single family house to the sanatorium and therefore for homeowners just as interesting as for tradesman. So that the investment advantage pays off and the planned cost reduction occurs, the nuts and bolts is the optimal planning of a CHP adapted to the needs for your object.

The BHKW-Zentrale stands for technically faultless solutions and selects independently with you from the leading manufacturers the optimal CHP for your needs. We are your contact persons from the first consultation up to the full maintenance agreement with a 10 years guarantee service.
